

Special effects

Shadow mapping with PCF

1. Render shadow map
2. Draw actual shadows in the scene with shadow map.

PCF was used for eliminating shadow acne.

Source: TU Vienna - Realtime Rendering / Repetitorium Slides

Bloom

1. Multiple render targets (1 default, 1 bright = elements exceeding threshold)
2. Gaussian Blur of bright elements
3. Mixing both together in post-processing shader

Note that this effect was disabled in the video because the effect would be too strong with the skybox, even then adjusting the threshold! For enabling/disabling bloom press "Tab", then under "Shaders" click on the "bloom checkbox". The "gaussian blur checkbox" is only for debugging purposes.

Particle System (Snow)

This effect was implemented with a gpu based particle system (1.000.000 particles, 200 particles per second). The spawn rate is framerate independent by using the delta time.

Other requirements

Automatic camera movement

This requirement was realized by using quaternions for SLERPs. A build in keyframe capture system makes it easier to define paths.

Performance

The demo was tested with two different GPUs at 1280x768 with solid 60FPS.

Additional libraries

GLEW / GLFW / GLM

The usual suspects for window and input management (GLFW), an OpenGL math library (GLM) and an extension loading library (Glew).

Assimp

A model loader library that was used for importing .obj and .fbx files.

<http://www.assimp.org/>

ImGui

An easy to use GUI library that was used mainly for visual debugging and changes without recompiling.

<https://github.com/ocornut/imgui>

SPDLOG

A logging library used as window logger in combination with ImGui as well as the console.

<https://github.com/gabime/spdlog>

STB_Image

An image loading library for loading different textures.

<https://github.com/nothings/stb>

3D Models

Models were either created with Blender and or modified from well known CG asset sites:

<https://www.cgtrader.com/>

<https://www.turbosquid.com/>

<https://sketchfab.com/>

Controls

- | | |
|-----|-----------------|
| Tab | Access GUI |
| 1 | Play Animation |
| 2 | Pause Animation |

- 3 Reset Animation
- F1 Wireframe
- F2 Face Culling

Testing

The application was tested with a GTX 560 TI as well as a GTX 1060 and maintained a constant 60FPS throughout the demo.

Further notes

- The engine (RTREngine) is mostly separated from the application (RTRDemo) itself.
- Different programming patterns for reasons such as decoupling were applied (Observer, Publisher Subscriber Model).
- Additional features
 - Logging system
 - Event system
 - GUI
 - Premake (as Build Tool)
